REFERENCES

Other POCUS applications, easy to learn and of increased anesthesiologic interest are: the evaluation of proximal lower extremity venous system for deep vein thrombosis diagnosis, the facilitation of placement of oro gastric tubes, the evaluation of a patients with low urine output and the estimation of intracranial pressure.

In conclusion, POCUS is progressively becoming more readily available and indications are continuously increasing. It is the day to consider its addition to the anesthesiologist’s toolbox as POCUS is rewriting medical history.
