

Supplementary Figure A1: Test for trend in stimulator time on, expressed as metric grouping by percent difference from the overall median MAE percent pain reduction of 78%. (A) Usage shows a statistically insignificant association with percent pain reduction as the percent usage above threshold increases to 100%. Number of patients in each grouping, left to right: [62,66,83,478] Bar heights represent median values within the group. Black bars show standard error. Lower subplot shows the percentage of patients included in each grouping.
